

# Classic Approach to Validation

One approach [2] for taking into account the uncertainties on the predictions relies on “appending” a statistical model directly to the observable quantities:

# Classic Approach to Validation

One approach [2] for taking into account the uncertainties on the predictions relies on “appending” a statistical model directly to the observable quantities:

There is no direct mapping between the observables to the Qols.  
This treatment says nothing about the effect of the model discrepancy on the Qols
